A.Accession: A60983
A.Molecule type: protein
A.Residues: '2', 2'-4', 2'-6-8AC>
C.Comment: This peptide induces DNA synthesis in immature thymocytes, but not periphe in a variety of immunoassays.
C.Comment: See PTR:A60957 (sheep) for discussion of another possible N-terminal modif C.Superfamily: thymic factor
C.Superfamily: thymic factor
C.Superfamily: thymic factor
C.Reywords: pyrroglutamic acid
F:1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           isotocin - common carp

cytotoxic T-lymphocyte proteinase 3 (EC 3.4.21.-) - western wild mouse (fragment) C; Species: Mus spretus (western wild mouse)
C; Species: O2-Jul-1996 #sequence_revision 02-Jul-1996 #text_change 05-Nov-1999
C; Accession: 149424
R; Ko, M.S.; Wang, X.; Horton, J.H.; Hagen, M.D.; Takahashi, N.; Maezaki, Y.; Nadeau, Mamm. Genome 5, 349-355, 1994
A; Title: Genetic mapping of 40 cDNA clones on the mouse genome by PCR.
A; Reference number: 148934; MUID:94319082
PEBS Lett. 382, 15-17, 1996
A;Title: Crystallization and preliminary X-ray diffraction analysis of boar seminal A;Tetle: Crystallization and preliminary X-ray diffraction analysis of boar seminal A;Accession: 562883 MUD:96196555
A;Molecule type: protein A;Residues: 15 <ROM>
C;Complex: heterodimer; seminal plasma protein I and seminal plasma protein II
C;Keywords: glycoprotein; heterodimer; semen

A; Residues: 1-9 < ERN>
C; Comment: This peptide induces DNA synthesis in immature thymocytes, but not peripheral
in a variety of immunoassays.
C; Comment: This peptide was isolated in two forms. One form contained the pyrrolidone ca
C; Comment: This peptide was isolated in two forms, one form contained the pyrrolidone ca
C; Superfamily: thymic factor
C; Superfamily: thymic factor
C; Keywords: blocked amino end; pyroglutamic acid
F:1/Modified site: pyrrolidone carboxylic acid (Glx) (in FTS) #status experimental
F:1/Modified site: blocked amino end (Glx) (in thymocyte growth peptide) #status experim

The peptide epitope W77119-W77138 were created for human tumour-specific cytocoxic T lymphocyte response. These peptides are are cysteinedepleted mutants of a native disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                                                                                                                                                                                                                               Disease specific immunogen – comprises disease specific cytotoxic \tau lymphocyte epitope used to elicit melanoma specific CTL response

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptides W39430-W39734 are used in a novel method for the selection of immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukcoyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral fammune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC class I allele HLA-A2.1.
                                                                                          T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatablilty complex; MHC; B cell; disease; anti-tumour; anti-viral.

Anying a human major histocompatibility complex (MHC) class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLAA subtypes HLA-AZ.1, AI, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound or HLA molecule, rather than the intact foreign antigen litself, and are particularly important in tummour rejection and in fighthing vital infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) are prostate cancer, hepatitis B and C AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or useful diagnostically, and can be used to induce a cytotoxic T cell with the peptide e.g. to produce CTLS x vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful can but immunisation as above.
                                             New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                     1mmunogenic peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Carcinoembryonic antigen; CEA; human; agonist; antagonist; immune response; carcinoma; gastrointestinal; breast; pancreatic; bladder; ovarian; lung; prostatic; T cell proliferation; cancer; adoptive transfer therapy; autoimmune reaction; immunotherapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences shown in W70044 to W70052 represent peptides derived from carcinoembryonic antigen (REA). The peptides can bind to a human leukocyte antigen (HLA), HLA-2.1 and are used to exemplify the method of invention of producing antigen. Specific cytotoxic T cells (TLS) in viro. The method comprises contacting immunogenic peptides from an antigen that binds class I major histocompatibility complex (MHC) molecules with antigen presenting cells (APCS) pretreated with pretreatment growth factors, and incubating the APCS with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antiger specific CTLs. A method for specifically Willing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contacting the cytotoxic T cells with APCS pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CTLs which are contacted with a carrier to form a composition. The composition can then be administered to the patient. The activated CTLs can be used for treating cancers, immune disorders, viral infections, and be used for treating cancers, immune disorders, viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic peptide having a human leukocyte antigen binding motif #2266.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human leukocyte antigen; binding; Immunogenic; glycoprotein; MHC; HLA; immune response: T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                        Production of antigen-specific cytotoxic T cells - by incubating immunogenic peptide(s) from antigen that binds class I major histocompatibility complex molecules with pre-treated antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                              its epitopes, particularly for treating gastrointestinal, breast, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, panocreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific

The peptides have conserved residues at certain positions such as positions 2 and 9. Also, the peptides do not comprise negative binding residues at other positions, such as positions 1, 3, 6 and/or 7 (peptides 9 amino acids long) and at poisons 1, 3, 4, 5, 7, 8 and/or 9 (peptides 10 amino acids long). The peptides are used to induce a cytotoxic T cell response to a preselected antigen. The method
immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Allele-specific binding motif; major histocompatibility complex; MHC; HLA; HLA-A2.1; cytotoxic T cell response; antigen; microbial infection; hepatitis; AIDS; malaria; condyloma acuminatum; cancer; prostate cancer; renal carcinoma; cervical carcinoma; lymphoma; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                expressing a specific Mic class I allele) with the present peptides. The peptides are used to treat and prevent microbial infection (e.g. in viral hepatitis B and C, human papilomavirus (HPV) infection, AIDS, cytomegalovirus (CMV), malaria, and condyloma acuminatum) and cancer (e.g. prostate cancer, renal carcinoma, cervical carcinoma, lymphoma). Patients in the acute phase of infection can be treated with the peptides in conjunction with other treatments. The antigenic peptides may be used to elicit cytotoxic T lymphocytes (CTLs) ex vivo and in vivo. The resulting CTLs can be used to treat chronic infections (viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HLA binding immunogenic peptides used to induce T cell activation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
or bacterial) or tumours in patients that do not respond to conventional forms of therapy. The peptides may also be used to produce monoclonal antibodies, which are useful as potential diagnostic or therapeutic agents. The peptides may also be used as diagnostic reagents.

cells (CTC), comprises introducing a lst pox virus vector, having at least 1 insertion site containing a DNA segment encoding a CEA peptide (i.e. the present peptide) to a host to stimulate CTC production, and at least 1 periodic interval after that, contacting the host with an additional antigen. The CEA specific CTC can be compounds which enhance the ability of the antigen to create a creen for compounds which enhance the ability of the antigen to create a cTC response. A host with a CEA expressing tumour can be treated by introducing the CTC to the host, and at least 1 periodic interval after that introducing a CEA peptide, i.e. the present peptide. The present peptide is positive for binding to HLA-A2, and scored supropriate peptide results in the upresponding of an appropriate peptide results in the upresponding of an appropriate peptide results in the upresponding of surface HLA-A2 antibody (background 280 and 300).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                     or antigonists (ID) of human carchinomic policy and carchine used in vaccines to kill or inhibit carchinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carchinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (ID) are used to inhibit CEA-specific. Ammune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but GEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                           The present invention describes peptides (A) that comprise agonists (Ia)

The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NCA analogue of residues 571-579 of carcinoembryonic antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      W40264-W40275 are peptide fragments of an R-specific amidohydrolase isolated from Klebsiella oxytoca strain PRS1. This enzyme allows the microorganism to utilise 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for preparing (R)-1soforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art optical resolution of the racemate using dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tri:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation - by stereoselective hydrolysis of corresponding racemic amide using microorganism or derived enzyme, used as drug intermediate
                                                    ŗ
                                                                                                                 The present peptide is negative for binding to HLA-A2, and scored 252 and 225 in T2 cell binding assays, where the binding of an appropriate peptide results in the upregulation of surface HLA-A2 on the T2 cells, which can be quantified via FACScan using an anti-HLA-A2 antibody (background 280 and 300).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   R-specific amidohydrolase; hydrolysis; racemate; nitrogen source; 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide; isoform.

Frective amounts of T cell receptor (TCR) peptides. The TCRs are present on the surface of T cells. The TCRs are chosen from V beta 6.2/3, V beta 6.7, V beta 7 or V beta 13.

The V beta TCR peptide-based vaccines are useful for prevention or treatment of multiple sclerosis (MS). The presence of V beta 6.7 appears to be particularly associated with multiple sclerosis and can be used to determine an individual's susceptibility to multiple sclerosis.

Vaccinating, rather than passively administering heterologous antibodies, allows the host's own immune system to mobilize and suppress auto agressive T cells. Therefore, the suppression is persistent and may involve any and all immunological mechanisms in effecting that suppression. Such a multi-faceted response is more effective than monoclonal antibodies or extant-derived regulatory T cell clones.

Yanging represent peptides derived from TCR V beta 6 clones found in the cerebrospinal fluid (CFS) of MS patients, after vaccination
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes vaccines which comprise immunologically

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in R88473-80 are internal tryptic peptides derived from trehalose-6-phosphate (Tre6P) synthase from M. Smegmatis. Tre6P is the Keye mrzyme in the synthesis of trehalose via Tre6P. The aim of the invention is to produce a transgenic plant with increase trehalose content. Tre6P in M. smegmatis is chepatin-activated and was isolated and purified. These peptides were derived from a protein which was purified with a mol. wt. of 55 kD which shared antigenic determinants with the yeast Tre6P content. Using these peptides probes may be designed for the isolation of the Tre6P gene (TSPI) for the production of the transgenic plants. The trahalose may be isolated from the transgenic plants. The trahalose may be isolated from the transgenic plants and used in bulk preparation including the preservation of the content of stock and structure of food stuffs during drying. Fruits and berries form the transformed plants may be processed into purees, jellies and increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

In an assay to determine IL-6 antagonist activity of this peptide, proliferation of the IL-6 dependent B9.9 hybridoma cell line (J.Immunol. 139: 4116, 1987) was inhibited. See R37216-R37261.
                                                                                                       The nucleotide sequence which encodes R78208, a B. thuringlensis (B.t.) endotoxin derived peptide, specifies the degenerate probe Q94857. The probe can be used for the detection of endotoxin producing B.t. microbes. The probe aids in the search for useful microbes hosting toxin encoding genes, specifically from nematode species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IL-6; antagonist; cytokine; B cell differentiation; inflammation; tissue injury; B9.9 hybridoma cell line; Castleman's Disease; Lennart's T-cell lymphoma; Non-Hodgkin's lymphoma; allergy; Immune deficiency disease; cardiac myxoma; mesangial proliferative glomerulonephritis.
               Nucleotide sequence used as probes to identify Bacillus thuringiensis - are derived from the B.thuringiensis endotoxin genes, for identifying microbes which encode toxins
                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide interleukin-6 antagonists - for treating and preventing auto-immune, immuno:inflammatory, neoplastic and infectious diseases etc.

                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             R73685-876 are potential peptide binders of HLA-A2.1 motif. Using motifs disclosed in the invention, these peptides were screened for further motifs. Only peptides with binding affinity of at least 1% (binding affinity is expressed as an IC50 value) as compared to the standard peptide (R71293) in assays. This peptide from LCWV (sic) Np antigen has a binding value of 0.0200. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg.

This is a randomised AB loop encoded by clone 7 (see V26501) of a large peptide library (2 million clones) of synthetic Pleckstrin homology (PH) domains with randomised discontinuous surface epitopes. The progenitor AB sequence comprises amino acid residues (5.21 of a stabilised synthetic PH domain (see W54310) of human cytohesin 1. The peptide library was generated by randomisation of AB and CD loop regions using randomised oligonucleotide primers (see W5492-309) of the peptide library are provided. Randomisation did not compromise the structural integrity and folding stability of the progenitor domain. The invention provides vectors that are used for the production of PH domain-like peptide libraries, which can be screened to identify peptides that have desirable properties, continuous in research or therapy, or as vaccines. Novel synthetic protein structural templates for the generation, screening and continuous of functional molecular surfaces are provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The sequences given in R35090-100 and R34628-32 are peptides which were used to design the probes given in Q40219-34. These probes can be used to identify Bacillus thuringiansis (Bt) DNA which encodes insecticidally active endotoxin. Probe (a) identifies genes encoding a toxin effective against any sort of insect. Sequences (b) and (e)-(l) are specific for toxins against lepidopters; sequences (c), (m) and (n) for toxins active against dipter and sequence (d), (o) and (p) for toxins active against coleoptera.
                                                                                              thuringiensis; Bt; insecticidal; active; endotoxin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gene probe for identifying endotoxin sequences in Bacillus thuringiensis - are universal, type specific or gene specific, for rapid detection and characterisation of insecticidal activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 20; DB 14; Length o; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Turbution and been developed for the diagnosts of numbers of the condition and such according to the diagnosts and prognosts of Rain a subject or for monitoring the effect diagnosis and prognosis of Rain a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally synchal fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance of each chosen feature in the sample of that chosen feature in the sample with the abundance of that chosen feature in the sample with the abundance of that chosen feature in chair one or more persons without RA, where the relative abundance of the chosen feature in the sample. The management of the chosen feature in the sample indicates the presence or absence of RA in the subject. The method on also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy of proteocols. Y41844 to Y42100 represent RPI peptides, Y42101 to Y42103 represent expression reference protein isoform peptides and Z2566 to Z25068 represent of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                            thuringiensis (B.t.) endotoxin derived peptides, specify the probes 094868 respectively. The probes can be used for the detection of endotoxin producing B.t. microbes. The probes aid in the search for useful microbes hosting toxin encoding genes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     coli; DNA polymerase III holoenzyme; probe; enzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated theta, chi, psi, delta and delta' protein sub:units of E. coli polymerase III holo:enzyme - used to make man-made enzyme of or 6 sub:units, useful for long chain PCR
                                                                                                                                                                              Nucleotide sequence used as probes to identify Bacillus thuringiensis - are derived from the B.thuringiensis endotoxin genes, for identifying microbes which encode toxins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ·

R69970-993 are nonameric mimotopes designed to show high diversity in hydrophobic moment and hydrophobic index, as well as charge distribution and size. The mimotopes are used in the method of the invention to obtain antibodies specifically and strongly reactive with a desired analyte. 16 of the peptides were tested for ability to bind the murine antibody Mab33-6, arbitrarily chosen, and known to bind to the peptides MB3 and MB4. 3 of the 16 peptides successfully bound Mab33-6. The mimotope is obtd. by reacting a panel of starting antibodies (Abs) representative of the resting B cell repertoire of a mimotope is obtd. by reacting analyte-reacting Abs) and then reacting each of a panel of candidate mimotopes representative of a random set of 3D contours with the analyte-reacting Abs. A subject is immunised with one or more mimotopes identified and the
from the tryptic peptides W36089-W36092 were used to isolate the chi subunit gene sequence from a lambda phage library.

The E. coli polymerase III subunits (thete, chi, psi, delta and delta (T98151-T98155 respectively)) are used to make man-made enzymes comprising 5 or 6 subunits and potentially for use in long chain pcR.
                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nonameric mimotope 24 used to obtain highly specific antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Producing antibodies with high specificity and affinity for an analyte - by immunisation with selected mimotope, also analyte detection kits, useful for immunoassay of materials usually analysed by HPLC
                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mimotope; antibody; production; high specificity; detection; immunoassay; high performance liquid chromatography.

This sequence represents a V8 proteinase digestion product of an isolated pure enzyme which is capable of catalysing the conversion of bnA to CO-DNA. CO-DNA is a form of DNA in which a carbonyl group is attached to the 1' carbon of the sugar constituent of the DNA. The enzyme can be used to convert DNA to CO-DNA which reduces or eliminates the ability of a cell to divide. The enzyme can be used for inhibiting cell proliferation and for treating tumours.
                                                                                                                                     CO-DNA; cell division; cell proliferation; tumour; lysilendopeptidase; N-terminal fragment; V8 proteinase digestion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; cancer-associated polypeptide; plu-1; ovarian cancer; vaccine; breast cancer; immune response; cytotoxic T lymphocyte; imaging agent; therapeutic; plu-1 antigen; breast tumor; tumor antigen; epitope.

                                                                                                                                                                                                                                                                                                                      The invention relates to a human cancer-associated polypeptide plu-1. The plu-1 polypeptide can be recombinantly expressed by standard recombinant methodology. Detection of the plu-1 nucleic acid or the polypeptide is used for the following: (1) diagnosis (including imaging) and prognosis of, and determination of susceptibility to, cancer, specifically ovarian or breast cancer; and il) treating cancer (by inducing an immune response against cancer cells, e.g. as avecine, or by antisense inhibition). Antigens derived from the polypeptide are used to generate activated cytotoxic T lymphocytes, or dendritic cells, for subsequent return to the patient for treatment of cancer. The polypeptide may also be used to identify inhibitors of plu-1 activity. Fragments of the polypeptide, and antibodies raised against plu-1, are useful as assay and imaging agents, also therapeutically (conduce an anti-idiotype response or where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 conjugated to cytotoxic agents). The plu-1 antigen is expressed more commonly in breast tumors than some known tumor antigens. Sequences Y55320-629 represent predicted peptides from the plu-1 polypetide which may bind to the human class I alleles B27, A2, A3 and A11.
                                                                                                                                                                                                                        New nucleic acid encoding the cancer-associated polypeptide plu-1, for diagnosis, treatment and prevention of cancer, especially of breast and

The invention relates to a human cancer-associated polypeptide plu-1. The polypeptide can be recombinantly expressed by standard recombinant methodology. Detection of the plu-1 nucleic acid or the polypeptide is cancer cancer; and diagnosis (including imaging) and prognosis used for the following: (i) diagnosis (including imaging) and prognosis of, and determination of susceptibility to, cancer, specifically ovarian or breast cancer; and i) treating cancer (by inducting an immune response against cancer cells, e.g. as a vaccine, or by antisense inhibition).

Controlly inhibitors of from the polypeptide are used to generate activated cytotoxic T lymphocytes, or dendritic cells, for subsequent return to the patient for treatment of cancer. The polypeptide may also be used to identify inhibitors of plu-1 activity. Fragments of the polypeptide, and antibodies raised against plu-1, are useful as assay and imaging agents, also therapeutically (to induce an anti-idiotype response or where commonly in breast tumors than some known tumor antigens. Sequences (%55320-629 represent predicted peptides from the plu-1 polypetide which may bind to the human class I alleles B27, A2, A3 and A11.
                                                                                                                                                                                                                                     New nucleic acid encoding the cancer-associated polypeptide plu-1, for diagnosis, treatment and prevention of cancer, especially of breast and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; cancer-associated polypeptide; plu-1; ovarian cancer; vaccine; breast cancer; immune response; cytotoxic T lymphocyte; imaging agent; therapeutic; plu-1 antigen; breast tumor; tumor antigen; epitope.

Claim 1; Page 75; 150pp; English.

```
The invention relates to a human cancer-associated polypeptide plu-1. The plu-1 polypeptide can be recombinantly expressed by standard recombinant content of the plu-1 nucleic acid or the polypeptide is blu-1 polypeptide can be recombinantly expressed by standard recombinant content of betection of the plu-1 nucleic acid or the polypeptide is used for the following: (i) diagnosis (including imaging) and prognosis cof, and determination of susceptibility to, cancer, specifically ovariant or breast cancer: and ii) treating cancer (by inducing an immune response corntigent cancer cells, e.g. as a vaccine, or by antisense inhibition).

Antigens derived from the polypeptide are used to generate activated cancer the patient for treatment of cancer. The polypeptide may also be used to identify inhibitors of plu-1 activity. Fragments of the polypeptide, and antibodies raised against plu-1, are useful as assay and imaging agents, also therapeutically (to induce an anti-idiotype response or where conjugated to cytotoxic agents). The plu-1 antigen is expressed more commonly in breast tumors than some known tumor antigens. Sequences 755320-629 represent predicted peptides from the plu-1 polypetide which commonly the human class I alleles B27, A2, A3 and A11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic peptide having a human leukocyte antigen binding motif #1144.
                  New nucleic acid encoding the cancer-associated polypeptide plu-1, for diagnosis, treatment and prevention of cancer, especially of breast and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

National to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cesponse against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in the mour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) corprevent viral infections and cancers in mammals (especially humans) they can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or served to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS a vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful chapturically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic peptide having a human leukocyte antigen binding motif #1673.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Southwood

having a human major histocompatibility complex (MHC) Class I (also having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding metif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes capainst the antigen from which the peptide is derived.

HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T ceptides can bind to a specific HLA allele (i.e. HLA-A subtypes cyalists the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound in a HLA molecule, rather than the intact foreign antigen itself, and care particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) corporate cancer, hepatitis B and C, ALDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptides are also useful perindes encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogenic peptide having a human leukocyte antigen binding motif #2143.

va5390 to V48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to marmally induced by an antigen in the form of a peptide fragment bound to man and in fighting viral infections. The peptides are therefore useful therapeutically to treat infections. The peptides are therefore useful therapeutically humans) or prevent viral infections and cancers in mammals (especially humans) or prevent viral infections as vaccines to calicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
CC phytase protein. The phytase protein may be used in the composition of the invention. The DNA encoding the phytase protein may be controlled in the carrichderma host which then expresses it and the controlled is collected from the culture medium. By using Trichoderma as controlled is collected from the culture medium. By using Trichoderma as containing the form the culture medium. By using Trichoderma as containing the series of a host for Aspergillus results. The enzyme composition compared to that secreted from comparitions for phytic acid or inositol hexaphosphoric acid from raw material, compositions for animals. By using Trichoderma as a source of a composition containing phytate degrading enzymes some difficult downstream processing problems, eg. filtration, that occur with xx similar Aspergillus compositions are avoided and yields are improved.
